Paper 4 Further Problem-solving and Programming Skills

May/June 2015

2 hours

9608/42

Candidates answer on the Question Paper.

No Additional Materials are required.

No calculators allowed.

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name in the spaces at the top of this page.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams, graphs or rough working.

Do not use staples, paper clips, glue or correction fluid.

DO **NOT** WRITE IN ANY BARCODES.

Answer all questions.

No marks will be awarded for using brand names of software packages or hardware.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

The maximum number of marks is 75.

Throughout the paper you will be asked to write either pseudocode or program code .	CON

www.papaCambridge.com A turnstile is a gate which is in a locked state. To open it and pass through, a cust 1 a coin into a slot on the turnstile. The turnstile then unlocks and allows the customer to turnstile and pass through the gate.

After the customer has passed through, the turnstile locks again. If a customer pushes the turnstil while it is in the locked state, it will remain locked until another coin is inserted.

The turnstile has two possible states: locked and unlocked. The transition from one state to another is as shown in the table below.

Current state	Event	Next state	
Locked	Insert coin	Unlocked	
Locked	Push	Locked	
Unlocked	Attempt to insert coin	Unlocked	
Unlocked	Pass through	Locked	

Complete the state transition diagram for the turnstile:

www.PapaCambridge.com 2 A declarative programming language is used to represent the knowledge base shown

```
01 capital city(amman).
02 capital city(beijing).
03 capital city(brussels).
04 capital_city(cairo).
05 capital city(london).
06 city in country(amman, jordan).
07 city_in_country(shanghai, china).
08 city in country(brussels, belgium).
09 city_in_country(london, uk).
10 city in country(manchester, uk).
11 country in continent (belgium, europe).
12 country in continent (china, asia).
13 country in continent(uk, europe).
14 city_visited(amman).
15 city visited (beijing).
16 city visited(cairo).
```

These clauses have the following meaning:

Clause	Explanation
01	Amman is a capital city
06	Amman is a city in the country of Jordan
11	Belgium is a country in the continent of Europe
14	The travel writer visited Amman

(a) More facts are to be included.

The travel writer visited the city of Santiago which is the capital city of Chile, in the continent of South America.

Write additional clauses to record this.

20	[4]

www.PapaCambridge.com (b) Using the variable ThisCountry, the goal country_in_continent(ThisCountry, europe) returns ThisCountry = belgium, uk Write the result returned by the goal: city in country (ThisCity, uk) ThisCity = **(c)** Complete the rule below to list the countries the travel writer has visited. countries_visited(ThisCountry)

- 3 A shop gives some customers a discount on goods totalling more than \$20. The discounts are:
 - 5% for goods totalling more than \$100
 - 5% with a discount card
 - 10% with a discount card and goods totalling more than \$100
 - (a) Complete the decision table.

				6				mm. P.	
A shop gives some customers a discount on goods totalling more than \$20. The discounts are: 5% for goods totalling more than \$100 5% with a discount card 10% with a discount card and goods totalling more than \$100 (a) Complete the decision table.									
Su	goods totalling more than \$20	Υ	Υ	Υ	Υ	N	N	N	N
Conditions	goods totalling more than \$100	Υ	Y	N	N	Υ	Υ	N	N
ŏ	have discount card	Υ	N	Υ	N	Υ	N	Υ	N
6	No discount								
Actions	5% discount								
	10% discount								

[4]

(b) Simplify your solution by removing redundancies.

SL	goods totalling more than \$20				
Conditions	goods totalling more than \$100				
ŏ	have discount card				
	No discount				
Actions	5% discount				
	10% discount				

[5]

(c) The simplified table produced in part (b) is used as a design for program code.

Write **program code** for this function.

www.PapaCambridge.com The following identifier table shows the parameters to be passed to the function Dis This function returns the discount amount as an integer.

Identifier	Data type		
GoodsTotal	INTEGER		
HasDiscountCard	BOOLEAN		

Programming language

A payroll program is to be written using an object-oriented programming language. A class is designed. Two subclasses have been identified:

 HourlyPaidEmployee who is paid a monthly wage calculated from their hourly rate and the number of hours worked during the month

SalariedEmployee who is paid a monthly wage which is one 12th of their annual salary

(a) Draw an inheritance diagram for these cla	asses
---	-------

b)		sign for the Employee class consists of:
	• pro	pperties
	0	EmployeeName
	0	EmployeeID
	0	AmountPaidThisMonth
	• me	ethods
	0	SetEmployeeName
	0	SetEmployeeID
	0	CalculatePay
	Write p	rogram code for the class definition of the superclass Employee.
	Progran	mming language

[3]

) (i) State the properties and/or methods required for the subclass HourlyPaid
) (i) State the properties and/or methods required for the subclass HourlyPaid
[4]
(ii) State the properties and/or methods required for the subclass SalariedEmployee.
[2]
) Name the feature of object-oriented program design that allows the method CalculatePay to be declared in the superclass Employee.
[4]

- Data is stored in the array NameList[1:10]. This data is to be sorted. 5
 - (a) (i) Complete the pseudocode algorithm for an insertion sort.

Mary
10
stored in the array NameList[1:10]. This data is to be sorted.
Complete the pseudocode algorithm for an insertion sort.
stored in the array NameList[1:10]. This data is to be sorted. Complete the pseudocode algorithm for an insertion sort. FOR ThisPointer ← 2 TO
<pre>WHILE (NameList[Pointer] > Temp) AND</pre>
<pre>// insert value of Temp in correct location NameList[] ←</pre>
[7]
A special case is when NameList is already in order. The algorithm in part (a)(i) is applied to this special case.
Explain how many iterations are carried out for each of the loops.

(ii)

(b) An alternative sort algorithm is a bubble sort:

```
www.PapaCambridge.com
FOR ThisPointer \leftarrow 1 TO 9
   FOR Pointer \leftarrow 1 TO 9
        IF NameList[Pointer] > NameList[Pointer + 1]
               Temp ← NameList[Pointer]
               NameList[Pointer] \leftarrow NameList[Pointer + 1]
               NameList[Pointer + 1] \leftarrow Temp
        ENDIF
    ENDFOR
ENDFOR
```

(i) As in part (a)(ii), a special case is when NameList is already in order. The algorithm in part (b) is applied to this special case.

Explain how many iterations are carried out for each of the loops.				
	[2]			

[Turn over © UCLES 2015

(ii)	Rewrite the algorithm in part (b), using pseudocode , to reduce the unnecessary comparisons. Use the same variable names where appropriate.

- 6 A queue Abstract Data Type (ADT) has these associated operations:
 - create queue
 - add item to queue
 - remove item from queue

The queue ADT is to be implemented as a linked list of nodes.

Each node consists of data and a pointer to the next node.

(a) The following operations are carried out:

CreateQueue
AddName("Ali")
AddName("Jack")
AddName("Ben")
AddName("Ahmed")
RemoveName
AddName("Jatinder")
RemoveName

Add appropriate labels to the diagram to show the final state of the queue. Use the space on the left as a workspace. Show your final answer in the node shapes on the right:

[3]

www.PapaCambridge.com

(b) Using pseudocode, a record type, Node, is declared as follows:

TYPE Node

DECLARE Name : STRING
DECLARE Pointer : INTEGER

ENDTYPE

The statement

DECLARE Queue : ARRAY[1:10] OF Node

reserves space for 10 nodes in array Queue.

(i) The CreateQueue operation links all nodes and initialises the three pointers that need to be used: HeadPointer, TailPointer and FreePointer.

Complete the diagram to show the value of all pointers after CreateQueue has been executed.

		Queue	
HeadPointer		Name	Pointer
	[1]		
	[2]		
TailPointer	[3]		
	[4]		
	[5]		
FreePointer	[6]		
	[7]		
	[8]		
	[9]		
	[10]		

[4]

www.papaCambridge.com

www.PapaCambridge.com (ii) The algorithm for adding a name to the queue is written, using pseudo procedure with the header:

```
PROCEDURE AddName (NewName)
```

where NewName is the new name to be added to the queue.

The procedure uses the variables as shown in the identifier table.

Identifier	Data type	Description
Queue	Array[1:10] OF Node	Array to store node data
NewName	STRING	Name to be added
FreePointer	INTEGER	Pointer to next free node in array
HeadPointer	INTEGER	Pointer to first node in queue
TailPointer	INTEGER	Pointer to last node in queue
CurrentPointer	INTEGER	Pointer to current node

```
PROCEDURE AddName (BYVALUE NewName : STRING)
   // Report error if no free nodes remaining
   IF FreePointer = 0
      THEN
         Report Error
   ELSE
      // new name placed in node at head of free list
      CurrentPointer ← FreePointer
      Queue[CurrentPointer].Name ← NewName
      // adjust free pointer
      FreePointer ← Queue[CurrentPointer].Pointer
      // if first name in queue then adjust head pointer
      IF HeadPointer = 0
         THEN
             HeadPointer ← CurrentPointer
      ENDIF
      // current node is new end of queue
      Queue[CurrentPointer].Pointer \leftarrow 0
      TailPointer ← CurrentPointer
   ENDIF
ENDPROCEDURE
```
